Re: ONR Grant No. N00014-97-1-G005, Nanophase Synthesis  
of Magnetic Materials: Thick Film Ferrite Magnetic Materials,  
Combined Performance and Final Technical Report,  
February 12, 1998

Dear Dr. Edelstein:

Enclosed per the requirements of the above referenced Grant are three copies of  
our Combined Performance and Final Technical Report with SF-298 for the grant period  
beginning February 13, 1997, through February 12, 1998.

Sincerely yours,

Charles J. O'Connor, Ph.D.  
Principal Investigator and  
Director of AMRI

**COMBINED PERFORMANCE AND  
FINAL TECHNICAL REPORT  
Grant No. N00014-97-1-G005  
February 12, 1998**

**INTRODUCTION**

The purpose of this report is to provide a combined performance and final technical report on the research activities performed by Dr. Charles J. O'Connor and his research group at the University of New Orleans under ONR Grant No. N00014-97-G005. The grant period is from February 13, 1997 to February 12, 1998. Included in this report are a general statement about the grant, a brief statement on the administrative activities associated with the grant, a brief summary of the research activities performed through this grant, and a list of presentations and papers derived in part with the support of this grant.

**GENERAL STATEMENT ABOUT THE GRANT**

The purpose of this grant was to support research on the fabrication and characterization of thick film ferrite magnetic materials as per our proposal dated January 1, 1997, entitled "Nanophase Synthesis of Magnetic Materials." This grant has provided initial funding for a much larger research program which was subsequently funded by DARPA to investigation of "Nanophase Magnetic Particles for Advanced Materials."

**ADMINISTRATIVE ACTIVITIES**

Key Personnel. The following key personnel were supported in part through this grant: Dr. Jin-Seung Jung (on sabbatical leave from Kangnung National University in Korea), as a post-doctoral researcher at AMRI, Everett Carpenter as a graduate assistant in Chemistry/AMRI, and Teresita Alcantara as a research associate at AMRI.

**RESEARCH ACTIVITIES**

The purpose of this grant was to support research on the fabrication and characterization of thick film ferrite magnetic materials as per our proposal dated January 1, 1997, entitled "Nanophase Synthesis of Magnetic Materials." Accordingly, through this grant we have continued our investigation of new synthetic routes for the preparation of nanophase magnetic materials. This grant has supported this work in three critical areas of materials research:

*Preparation of Nanophase Materials in Restricted Environments.* Of particular interest to our research group in the synthesis of nanophase magnetic materials is the use of self-assembly processes in the confined media of reversed micelles to prepare nanocomposite magnets with variable and temperature dependent remanence and

coercivity. In earlier work, we have been able to synthesize superparamagnetic ferrites and wide band-gap semiconductors (CdS and TiO<sub>2</sub>) using such environments. We have pursued this line of work and have focused on the concept that particle nucleation in the restricted environment of reversed micelles leads to confined growth of nanoparticles. The nanoparticles which are produced remain suspended in the host liquid medium to form a stable ferrofluid. The fluid microstructure provides a template for the synthesis and formation of superparamagnetic nanoparticles. Thus, it is possible to synthesize magnetic nanoclusters which are functionalized onto, or which are encapsulated into, specific conjugated polymer matrices. Such syntheses are carried out in spatially and geometrically restricted environments which restrict the growth of the inorganic clusters to the nanometer scale and in the case of lipid gels, impose a three-dimensional ordering of the nanoclusters. These polymer-magnetic nanocomposites find varied applications in ferrofluid technology, information storage, magnetic refrigeration, magnetic separations, magneto-optics, and so on.

*Encapsulation of Magnetic Nanoparticles in Polymer Microspheres.* We have also continued the study of synthetic approaches for the encapsulation of superparamagnetic ferrite nanoparticles in polymer microspheres with controlled internal densities. Using the restricted environments of reversed micelles, we have been able to prepare polymer-ferrite nanocomposites which exhibit superparamagnetism. This synthetic approach is coupled with our interest in exploring the role of the matrix in modifying the magnetic characteristics of nanoscale particles which are embedded in the polymer matrix. Because the polymer used is a highly functionalizable material, polyphenol, the nanocomposite is well suited for applications in magnetic bio-separations and magnetic coatings.

*Evaluation of the Properties of Polymer-Ferrite Nanocomposites.* Through this grant, we have been able to continue our studies into the characterization of superparamagnetic and other physical properties of polymer-ferrite nanocomposites, including photomagnetic and magneto-optical response in nanocomposite materials.

This grant has provided support for our research in these three areas of materials science. Some of this work described above has provided data for presentation at conferences and in the literature as follows:
